Title

Internet of Things (IoT) Temperature Monitoring System

Department of BBA(CA) SEM-VI

Academin Year-2026-2027

Subject

Internet of Things (IoT)

Submitted By

Shivam Paswan

1.Introduction

This project demonstrates a simple IoT-based temperature monitoring system using Arduino and TMP36 sensor in Tinkercad simulation.

2. Components Used

Arduino UNO, TMP36 Sensor, LED, Resistor, Breadboard, Jumper Wires

3. Working Principle

The TMP36 sensor reads temperature and sends analog data to Arduino. If temperature exceeds 30°C, LED turns ON.

4. Circuit Description

TMP36: Left->5V, Middle->A0, Right->GND. LED: Pin 13 to GND via resistor.

5. Code Explanation

Arduino reads analog value, converts to temperature

and controls LED based on threshold.

6. Output

Temperature values displayed in Serial Monitor. LED ON above 30°C.

7. Conclusion This project successfully demonstrates temperature monitoring using IoT simulation
